

# How the Immune System Works

- **Antigens** enter/ invade the body.
- The body recognizes the antigens and the **cells respond**.
- **B-Lymphocytes** produce antibodies that **counteract** the antigens. The **T-lymphocytes** then **destroy** the antigens.
- The **antibodies stay** in the person's body, so that if the antigens invade the body again, the body knows how to react.
